

— **STARTUP CONCEPT**

Devception

Among Us for Coders

A multiplayer coding game where developers collaborate, compete, and suspect each other while solving real programming challenges in real time.

Game-first coding practice

Social deduction mechanics

Real-time collaboration

CORE IDEA

Coding practice becomes a real-time social game.

Devception combines collaborative programming challenges with hidden-role gameplay. Players work together to complete a shared code problem while one or more imposters quietly try to slow the team down.

```
$ join lobby --language javascript --skill intermediate
role: hidden
mission: solve the codebase before time runs out
```

01

Game mechanics meet code

Instead of isolated submissions, developers interact through roles, tasks, sabotage, discussion, and voting.

02

Collaboration is the product

The main challenge is designed for multiple contributors, with modular fixes and shared progress.

03

Innovative learning loop

Players practice coding, communication, debugging, and judgment inside a high-engagement match format.

04

Long-term vision

A social developer arena for learning, hiring, community tournaments, and skill-based multiplayer coding.

WHY IT MATTERS

Most coding practice feels useful, but not alive.

Traditional coding platforms are effective for repetition, but they rarely capture the energy of real teamwork, competition, communication, or social pressure.

- **Solo by default**
Many experiences reduce practice to isolated problem solving with limited peer interaction.
- **Low engagement**
Static assessments and endless problem lists can feel repetitive, especially for early learners.
- **Flat competition**
Hackathons and contests often lack live gameplay feedback once the timer starts.
- **Limited soft-skill signal**
Most platforms do not surface communication, collaboration, debugging judgment, or trust dynamics.

DEVCEPTION APPROACH

Turn coding into a team sport with tension.

Devception makes coding challenges interactive by adding real-time synchronization, team strategy, hidden information, task pressure, and competitive win conditions.

**BUILD TOGETHER****Shared coding environment**

Players edit, review, and test the same challenge while mini tasks move the team toward completion.

Real-time coding

**QUESTION INTENT****Social deduction layer**

Imposters create subtle disruption; teammates use meetings, chat, and voting to identify sabotage.

Hidden roles

**TRACK MOMENTUM****Progress and scoring loop**

Live progress, tasks, timer pressure, and outcome screens create a clear match arc.

Game-first UX

PRODUCT SURFACE

A multiplayer coding engine wrapped in a game UI.

The MVP focuses on the core match loop while leaving room for community, content, and competitive expansion.

Multiplayer coding engine

Shared editor experience for team-based challenge solving.

Real-time sync

Socket.IO-powered updates for code, lobby state, chat, and gameplay events.

Lobby matchmaking

Skill and language filters to form compatible player groups.

Task mechanics

Individual mini challenges keep every player active during the match.

Live progress

Visible team momentum through timers, completion state, and task updates.

Team gameplay

Good Coders collaborate, discuss, debug, and protect the codebase.

Competitive modes

Role-based objectives create replayable tension beyond standard coding drills.

Backend foundation

Express and Socket.IO architecture for rooms, events, roles, tasks, and votes.

Scalability paths

Future support for ranked queues, custom rooms, content packs, and tournaments.

Community layer

Potential Discord integration for parties, events, identity, and creator-led sessions.

GAMEPLAY FLOW

A clear match loop from lobby to win condition.

Each session is built around a fast, understandable flow that combines coding output with player behavior.

1

User joins game

Player enters the platform, chooses skill level and language, then joins a lobby.

2

Team formation

Players are grouped into a match; roles are assigned privately at start.

3

Challenge assignment

The team receives a shared modular code problem plus individual mini tasks.

4

Real-time coding

Players edit, test, chat, observe suspicious changes, and react to sabotage.

5

Progress updates

Task completion and code validation update the shared progress state.

6

Win or score

Good Coders win by solving or voting correctly; Imposters win by delaying completion.

MVP REALITY

Built to validate the concept before scaling.

Devception is currently an MVP-stage product focused on proving the core gameplay loop: real-time coding, multiplayer coordination, hidden-role disruption, and match flow.

MVP completed

The initial playable version exists with the main product structure in place.

Core gameplay functional

Lobby, roles, tasks, meetings, chat, and match state are built around the central loop.

Real-time systems implemented

Socket-based interactions support synchronization across gameplay events.

Testing and improvement phase

The immediate focus is iteration, stability, usability, and validating user engagement.

Now

Validate whether developers find the match loop compelling enough to repeat and share.

Next

Improve challenge quality, polish UI feedback, harden multiplayer state, and test with small groups.

Later

Explore ranked modes, custom rooms, creator challenges, communities, and developer events.

No inflated traction

Concept-first validation

Scalable product thesis
